Competence in Plastics

AGRU Kunststofftechnik GmbH is an Austrian company. AGRU proves its competence and innovation in the development and production of high-quality products which are made of thermoplastic polymers, for almost 50 years.

The product group AGRULINE offers a complete and first-class range of pipes, fittings, valves and special parts made of polyethylene for the environmentally friendly and safe supply of natural gas and potable water as well as the disposal of sewerage. The most modern machinery and well-trained special staff ensure production of highest grade products.

FM approved PE 100(-RC) pipes and fittings

Many industrial companies operate special fire-fighting systems to prevent property losses. A complete fire-fighting system needs underground pipelines (main lines) with easy accessible fire hydrant connections. The material PE 100(-RC) is slowly advancing to one of the most used materials for fire-fighting applications. AGRU offers one of the most complete product ranges of FM approved PE 100(-RC) pipes and fittings for underground fire service mains worldwide. Customers from various business fields trust into AGRU's high quality products and its years of experience. Both of it leads to a perfect solution. That makes AGRU the reliable partner when it comes to prevent property loss.

1 Factory Mutual

1.1 Ensuring Quality, Dependability and Performance

FM global is the world's largest commercial and industrial property insurance and risk management organisation specialising in property protection. FM Approvals certifies products and services for thousands of companies worldwide to help improve and advance property loss prevention. Globally recognized and respected, the FM APPROVED mark assures a product or service has been objectively tested and conforms to appropriate FM Approvals, national and international standards. Customers rely on FM Approvals for assurance that FM Approved products and services will perform as intended and support property loss prevention.

1.2 Benefits of FM approved products:

- Tested under extreme conditions
- Reliable performance due to regular quality audits of producers
- Technical product support by local representatives
- Product approval can help manufacturers and service providers:
 - // Meet client demands
 - // Accordance to code and jurisdictional installation requirements worldwide
 - // Achieve competitive advantage, whether at home or in the global marketplace
 - // Move products to market fast on a global basis

1.3 Standard

Agru offers a broad product range that is tested and certified for fire protection systems. The performed and approved standards for these high quality products are:

Approval standard for Polyethylene (PE) Pipe and Fittings for Underground Fire Protection Class Number 1613

Date: February 2006. EN 12201, ISO 4427, AWWA C 906

Information about installation and maintenance of FM pipe systems can be found at:

Information about installation and maintenance of private fire service mains and their appurtenances.

FM data sheet 3-10, NFPA 24

2 Material PE 100(-RC)

Agru produces FM approved pipes and fittings from high quality PE 100(-RC) resin material. This material is perfect suitable for fire fighting systems and has been successfully used since many years. From the easy and cost saving installation to the maintenance free and safe operation there are only positive references from both installers and operators.

The features of PE 100(-RC) summarized:

- Lightweight – easy and fast installation
 - // Cost saving due to less fittings are needed for installation
 - // No damages at seismic activities like soil settlements (e.g. earthquakes)
 - // High resistance against pressure surge (water hammer)
- Smooth surface
 - // No corrosion, less abrasion or incrustation
- Secure connection due to homogeneous welding techniques
- Environmentally friendly because 100 % recyclable
- UV resistance (with carbon black)
- Low microbial growth
- Application at a broad temperature range

Material properties of the used high-grade resins (with regression curves acc. to ISO 4427) are stated in the following table 1:

	Properties	Standard	Unit	PE 100(-RC)
mechanical / physical	MRS Classification	ISO 9080	N/mm ²	10
	Specific density at 23 °C	ISO 1183	g/cm ³	0,96 ²

- 1) DVS 2207-1
- 2) EN 12201
- 3) DVS 2205-1 BB1
- 4) DVS 2210-1

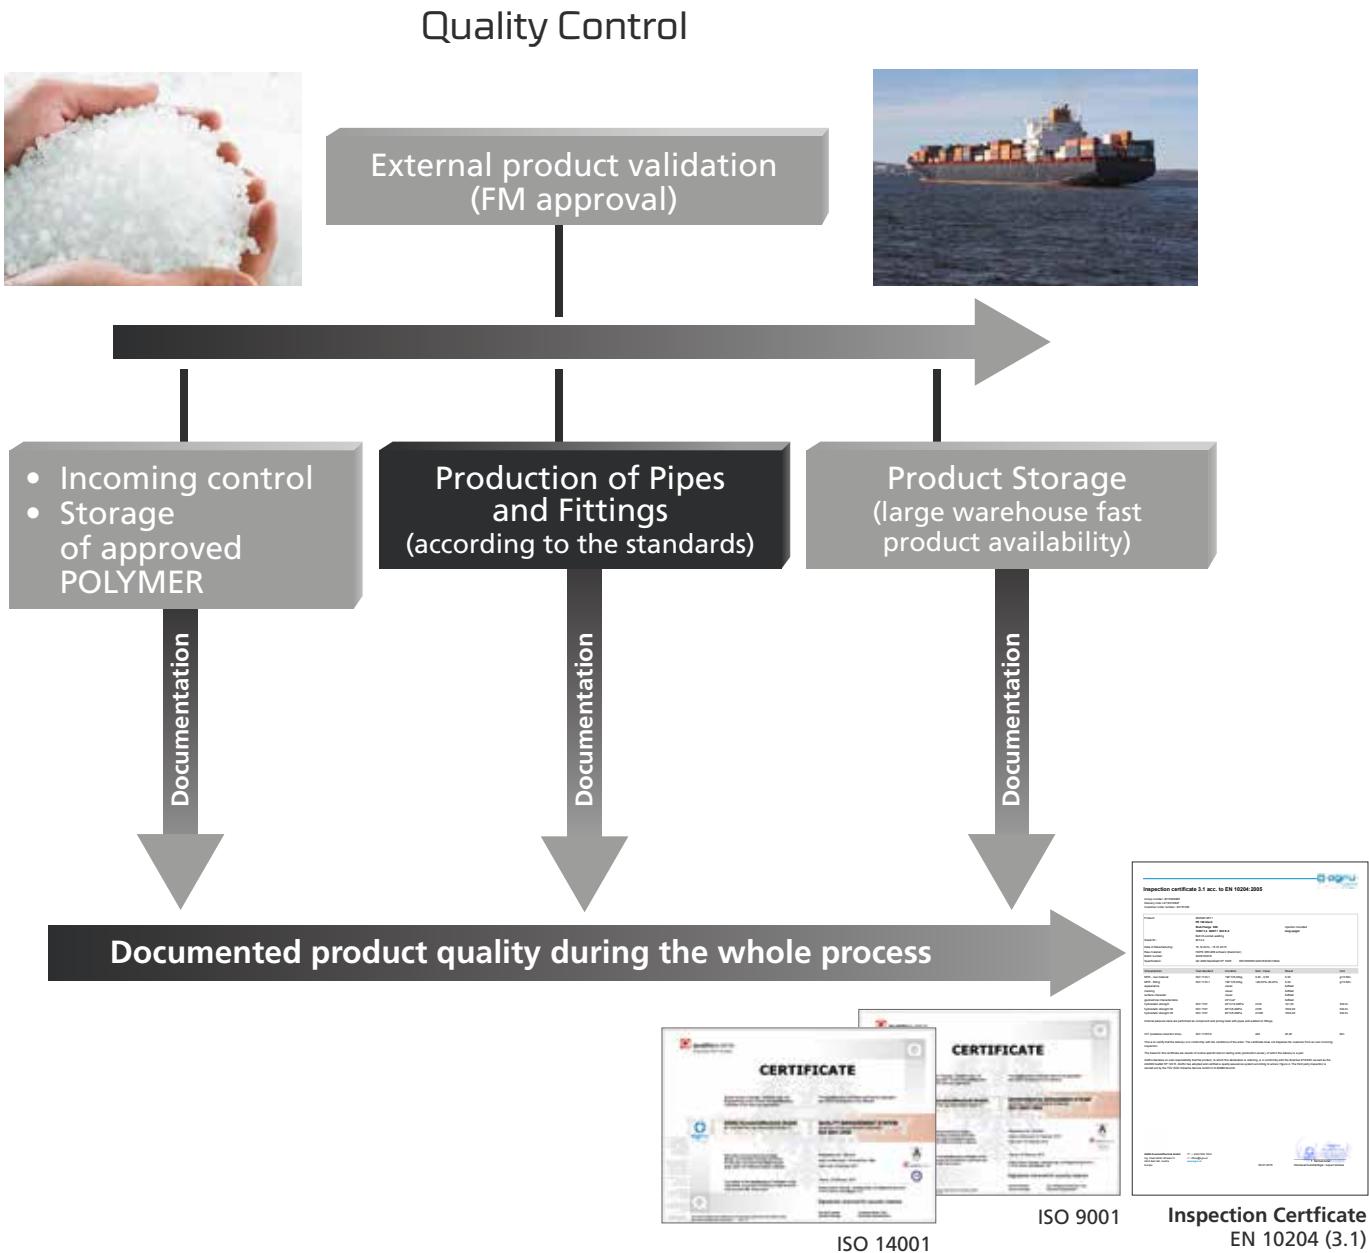

* depending on the application area and operating time

3 Chemical resistance

PE 100(-RC) pipes are chemical resistant against inorganic/organic acids, inorganic salts and media with basic character ($\text{pH} > 12$) even up to high concentrations. Organic chemicals and the molecular chain of the PE 100(-RC) polymer are very similar, they are structurally related to each other. The organic media might have a swelling effect on PE 100(-RC). Swelling means, that the distance between the molecular chains increases. There is a change in volume and shape due to the influence of the organic media. Swelling is an invertible process, in case that there is no contact between the organic media and the HDPE polymer, the swelling effect disappears. The organic media, which are present in foams for fire-fighting do not have a significant chemical effect on PE 100(-RC).

4 Quality assurance

AGRU certified products by FM are produced according to ISO 9001, ISO 14001, EN 12201 and FM approval standard 1613. There are standardized inspections for all incoming raw materials as well as during the production and at the finished product before shipment. Inspection certificates according to EN 10204 can be forwarded for each item on request.

5 Marking

As required by FM approval standard 1613, all FM approved pipes and fittings shall bear the Approval Mark clearly visible. The Approval Mark shall be displayed visibly and permanently on the products.

5.1 Marking of fittings

FM approved fittings are marked according to EN 12201-3. Additionally the FM approved certification mark including the maximum operating pressure and maximum water velocity is attached on the fittings.

5.2 Marking of pipes

FM approved pipes are marked according to EN 12201-2. Additionally the FM certification mark including the maximum operating pressure is printed on the pipes.

6 Connection of FM approved pipes and fittings

Agru pipes and fittings for firefighting systems are generally joined by heated tool butt welding, electrofusion welding or mechanically through the use of flanges. The appropriate connection technique depends on the location and the project requirements itself. Detailed guidelines for all connection techniques are available on request.

6.1 Heated tool butt welding

At the heated tool butt welding process, the joining zones of the components to be welded are aligned under pressure on the heated tool (alignment), heated up to the welding temperature with reduced pressure (heating up) and joined under pressure (joining) after removal of the heated tool (changeover).

6.2 Electrofusion welding

Agru FM Electro-fusion fittings can be used to weld the required components using resistance wire (heating wire). The heating wire is completely embedded in the fitting. This provides a smooth inner surface and allows an easy cleaning and insertion of the pipe ends/spigots. Universal welding machines are suitable and provide the required power supply.

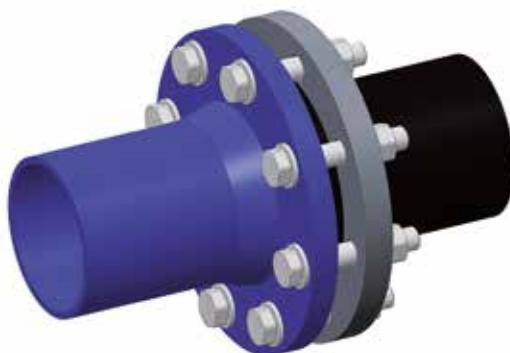

6.3 Flange connections:

Flange connections are used to create detachable connections between PE – PE, or as transition from PE to other materials (e.g steel, ductile iron. For example when pipes are connected to valves).

PE-PE Flange connection

Steel-PE Flange connection

To implement valves into Agru fire fighting pipelines, the valve must be supplied with flanges. To establish a suitable and reliable connection it is essential that the flanges of the valve and the pipeline are designed according to the same standards. The following Flange designs are available from Agru:

DIN	Design according to EN 1092-1:2013 PN 10
ANSI	Design according to ASME B16.5:2013 class 150

Valve connection

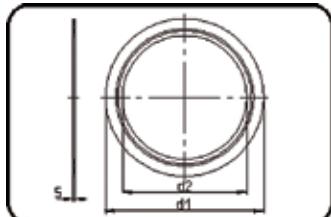

The recommendations below should be considered to ensure a durable and leak proof flange connection:

- It is recommended to coat the bolts for the flange connection with molybdenum sulfide grease to ensure a smooth operation, even during a long operation period.
- When choosing a seal material, consider its thermal and chemical suitability.
- The bolts shouldn't protrude further than two to three thread lengths after the nut.
- Washers have to be placed at the bolt head and also at the nut.
- Before applying the bolt initial pre-stress, the sealing faces have to be aligned coplanar to each other and fit tight to the sealing.
- Adjusting the position of the sealing faces by means of bolt pre-tensioning using a spanner is not permissible.
- The required bold-tightening torque depends on the shape and the selected material of the seal (Shore A hardness) as well as on the friction in the screw thread and on the nut contact face (average friction coefficient of 0.15 can be expected). Please find guide values in table 2.
- The connecting bolts have to be screwed diagonally by means of a torque key (torque values see table D.8).
- The bolting torque must induce a certain amount of compressive stress on the elastomeric seal ($\geq 0,5 \text{ N/mm}^2$). Below this minimum compressive stress a leak may occur. Otherwise, an excessive compressive stress may cause damage and deformation of the seal area (seal, stub end, backing ring, etc.).
- Flange connections which are exposed to alternating stresses and heavy impacts, have to be checked within prescribed maintenance intervals and retightened if necessary.

6.3.1 Gaskets

Based on our experience we recommend the use of the following gasket types:

From **OD 63 up to OD 315** seal clean PTFE gaskets are perfect suitable for firefighting systems. Seal Clean gaskets exhibits outstanding pressure and creep resistance combined with high stability. In comparison to other gaskets, the Seal Clean provides significant less settlement because of its better creep behaviour and therefore a better leak tightness even with occurring temperature- and pressure changes.

- Seal Clean Gasket
- Flange connection
- ePTFE white

6.3.2 Tightening torques for bolts:

The following tightening torques are recommendations according to long term experiences:

OD	BOLTING TORQUE [NM]	GASKET TYPE
63	40	Seal Clean
75	55	
90	50	
110/125	45	
140	50	
160/180	80	
200/225	110	
250/280	110	
315	110	
355	70	
400	80	Profiled gasket (depending on the design, has to be clarified case by case)
450	90	
500	100	

Table 2: Recommended tightening torque for bolts
(for installation of the Seal Clean gasket follow the installation guideline)

Flange connection with valve

7 System pressure rating

There are 2 complete product ranges for firefighting systems available from Agru: FM approved per approval standard 1613 for 175 psi (12 bar, SDR 11), and for 200 psi (14 bar, SDR 9). This pressure designation means maximum operating pressure for firefighting systems, at 23 °C. It is calculated and tested that all the system components can handle 4 times of the specified pressure in case of a water hammer without any failure.

According to the EN 12201 standard, the maximum operating pressure for SDR 11 is 16 bar and for SDR 9 20 bar at 20 °C and 50 years operating time. Agru pipes and fittings are certified for this pressure. According the test requirements of FM 1613 approval standard (short term hydrostatic strength test at 4x certified pressure) Agru pipes and fittings used for firefighting systems are limited to the pressure rates as shown in **Table 3** (certified pressure).

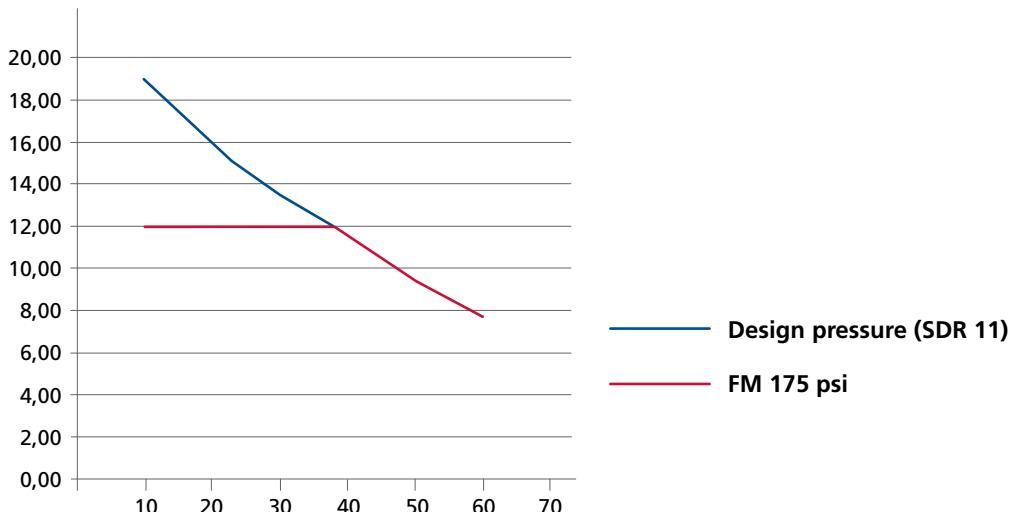

Recommended pressure calculation for Agru firefighting pipes and fittings:

- As a design basis the values of the EN 12201 standard can be used (design pressure).
- The actual operating pressure should not exceed the certified pressure values in the **Table 3** and **Table 4** below.
- As temperature increases, a de-rating of the service pressure has to be considered. The calculated and tested pressure ratings depending on temperature and operating time are also stated in **Table 3** and **Table 4**.

7.1 Maximum operating pressure of approved pipes and fittings for 175 psi

Temperature (°C)	Operating period (years)	Design pressure according to EN 12201 (SDR 11)	Certified pressure for firefighting systems (175 psi) (operating pressure)
		(bar)	(bar)
10	50	19.0	12.0
20	50	16.0	12.0
23	50	15.1	12.0
30	50	13.5	12.0
40	50	11.6	11.6
50	15	9.4	9.4
60	5	7.7	7.7

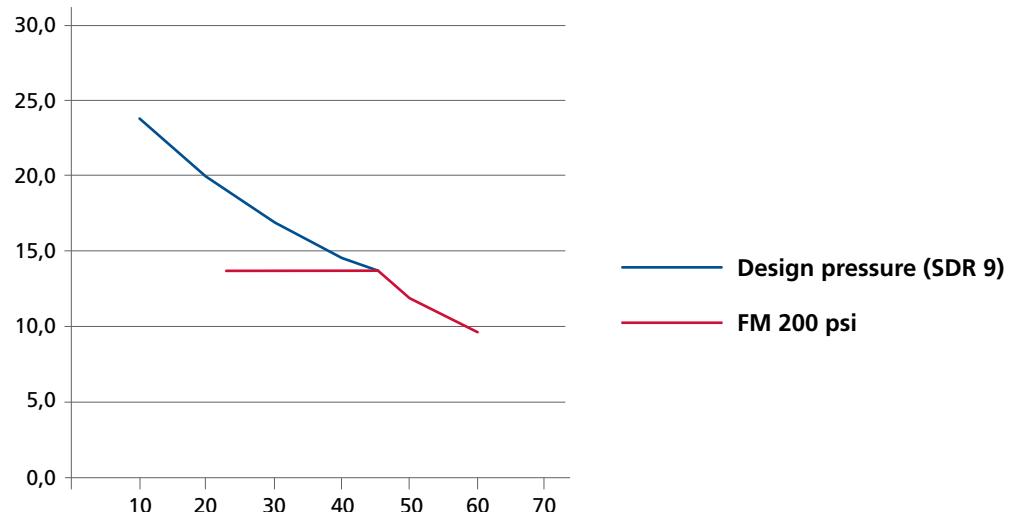

Table 3: Mop of Agru products 175 psi for firefighting systems

7.2 Maximum operating pressure of approved pipes and fittings for 200 psi

Temperature (°C)	Operating period (years)	Design pressure according to EN 12201 (SDR 9) (bar)	Certified pressure for firefighting systems (200 psi) (operating pressure) (bar)
10	50	23,9	14,0
20	50	20,0	14,0
23	50	19,1	14,0
30	50	17,0	14,0
40	50	14,6	14,0
50	15	11,9	11,9
60	5	9,7	9,7

Table 4: Mop of Agru products 200 psi for firefighting systems

8 Hydraulic pressure losses

PE 100(-RC) pipes and fittings have a smooth abrasion- and incrustation resistant surface. Furthermore water does not corrode PE 100(-RC) pipes and fittings so that the Hazen-Williams flow coefficient "C" of 150 remains practically constant throughout the whole service lifetime. This safes energy costs (pump operating costs) and ensures a reliable and efficient performance in case of a fire emergency.

The main factors for losses are:

- Length of the piping system
- Pipe cross section
- Roughness of the pipe surface
- Geometry of fittings, mountings and finished joints or couplings
- Viscosity and density of the fluid

The whole pressure loss results from the sum of the following individual losses:

$$\Delta p_{\text{ges}} = \Delta p_R + \Delta p_{RF} + \Delta p_{RA} + \Delta p_{RV}$$

Formula 1: Total pressure loss

Δp_{ges} total pressure loss [bar]

Δp_R pressure loss in straight pipes [bar]

Δp_{RA} pressure loss in mountings [bar]

Δp_{RF} pressure loss in fittings [bar]

Δp_{RV} pressure loss in finished joints or couplings [bar]

8.1 Pressure loss in straight pipes

Pressure loss in straight pipes is inversely proportional to the pipe cross section.

$$\Delta p_R = \lambda \cdot \frac{L}{ID} \cdot \frac{\rho}{2 \cdot 10^2} \cdot v^2$$

Formula Pressure loss in straight pipes.

ID inside diameter of pipe [mm]

L length of piping system [m]

Δp^R pressure loss in straight pipes [bar]

λ pipe frictional index 0.02 (sufficient in most cases) [1]

v flow velocity [m/s]

ρ medium density [kg/m³]

Pressure loss in pipes can also be calculated with the empirical Hazen-Williams equation.

$$h = \frac{10,67 \cdot q^{1,85}}{c^{1,85} \cdot d_h^{4,8655}}$$

h head loss per unit pipe [mh20/m pipe]

c design coefficient (PE-HD = 150)

q flow rate [m³/s]

d_h inside hydraulic diameter [m]

8.2 Pressure loss in fittings

Inside the fittings friction, deflection and detachment cause considerable pressure losses. The resistance coefficients, used for the calculation can be taken from the following chapter.

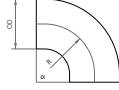

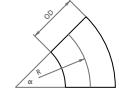

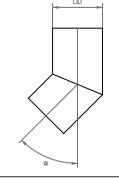

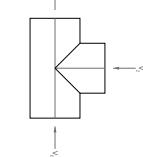

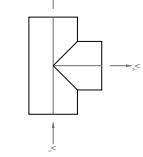

$$\Delta p_{RF} = \zeta \cdot \frac{\rho}{2 \cdot 10^5} \cdot v^2$$

Δp_{RF} pressure loss in fittings [bar]

ζ resistance coefficient for fittings [1]

v flow velocity [m/s]

ρ medium density [kg/m³]

	2.0	0.034	0.042	0.017

Positive ζ -values represent a pressure drop, whereas negative ζ -values represent a pressure increase.

VA outgoing volume flow

VD continuous volume flow

VS total volume flow

VZ additional volume flow

9 Installation of firefighting pipe systems

Polyethylene pipe systems should be installed according to the national requirements and laws, the manufacturer's instructions and FM Global Property Loss Prevention Data Sheets (FM data sheet 3-10: Installation and maintenance of private fire service mains and their appurtenances).

FM Approved PE pipes and fittings according to the approval standard 1613 are for underground installed use only!

9.1 Trench design for buried FM pipelines

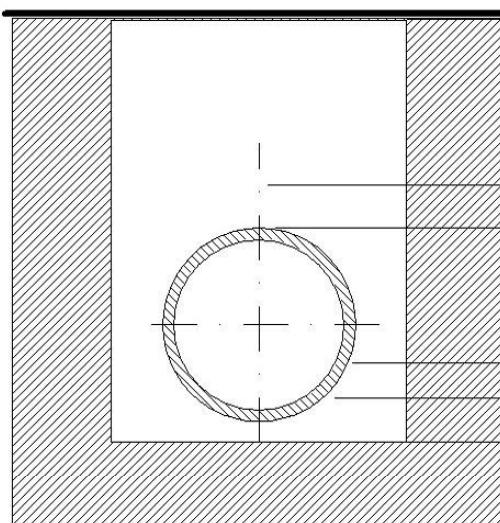

The following recommendation is according to EN 805 and ÖVGW G E100. For the pipe trench construction and the installation of the pipes corresponding national and regional regulations have to be taken into account.

The following influence factors on the installation technique and –depth have to be considered:

- Depth of frost or heat penetration (local conditions)
- Flow rate, pressure and temperature of the media in the pipeline
- Insulation of the pipeline
- Traffic and soil loads
- Soil type, soil moisture and the surface condition
- Crossing lines
- Sufficient compressability of the soil around the pipeline

A structural analysis considering all influence factors should be performed by a professional engineer before each installation. For this purpose acknowledged calculation guidelines (e.g. AWWA M55, ÖNORM B5012, ATV 127) have to be used. It has to be ensured that the soil around the pipe can be properly compacted to fix the pipe in the trench.

The trench depth should be excavated considering national standards. In doing so the crown of the pipe should be located underneath the depth of the frost. The trench bottom should be planar, stable and free of stones. A bedding layer of at least 10 cm (rocky ground: 15 cm) should be placed on the trench bottom. The pipeline should be lowered into the trench carefully. Additionally an all-side cover has to be created (at least 10 cm) to avoid scratches and point-loads on the pipe.

OD

Outside pipe diameter

Trench width

minimum OD + 40 cm

Cover height

minimum 80 - 100 cm (at least 2 x OD and underneath the depth of frost)

Lower bedding

minimum 10 cm, out of embedding material like sand (particle size 0....4 mm, fine quota 15%)

Bedding zone

embedding of the pipe should achieve minimum 10 cm out of the same potting material;

9.2 Thrust blocks

PE 100(-RC) pipes and fittings are connected homogenously and are force-locked longitudinally. The welded joints can take the same longitudinal forces than the pipe.

If the pipeline is properly installed and the bedding material is compacted according to common standards, it is not necessary to install thrust blocks (there is no European standard which requires thrust blocks for welded PE pipelines). Due to the flexibility of the PE100(-RC) materials, the thermal expansion/contraction (caused by temperature difference during the operation) is compensated by properly compressed soil around the pipe.

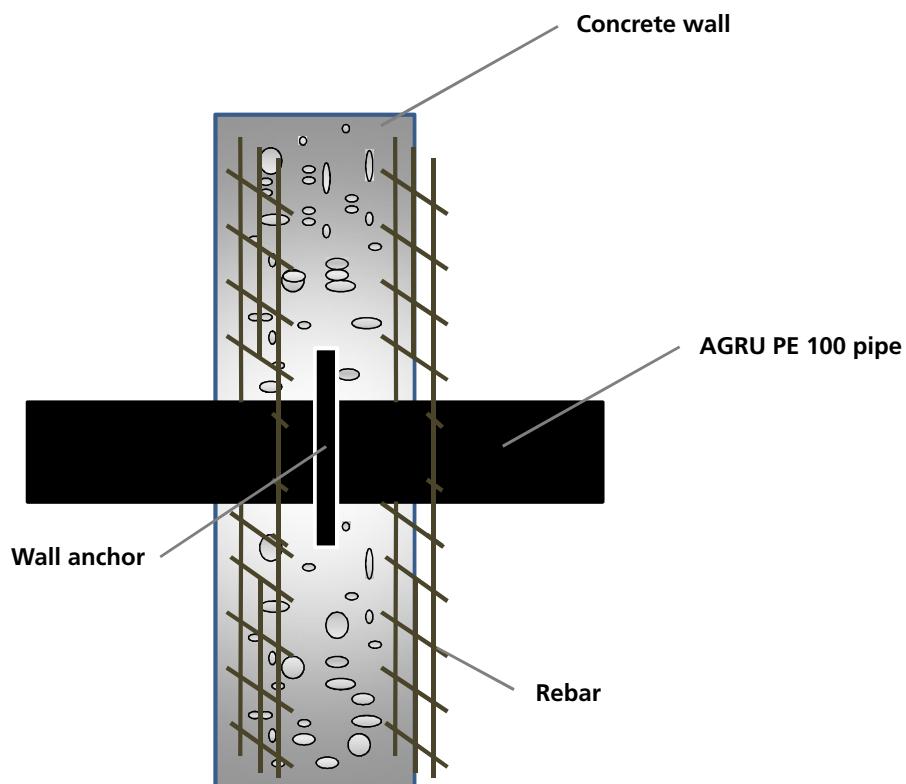

Long term field experiences have shown that thrust blocks aren't needed for PE 100(-RC) pipelines and that PE pipelines resist soil settlements. Also according to AWWA Manual M55, welded and flanged PE connections are fully restrained and do not require external joint restraints of thrust block joint anchors.

If sufficient soil conditions are not given (no proper soil stability), geotextile fabrics, and / or cement stabilized sand should be used for supporting the trench bottom .

An experienced engineer (in soils) is responsible for evaluating the soil conditions and defining the correct installation parameters to ensure perfect operation of the system.

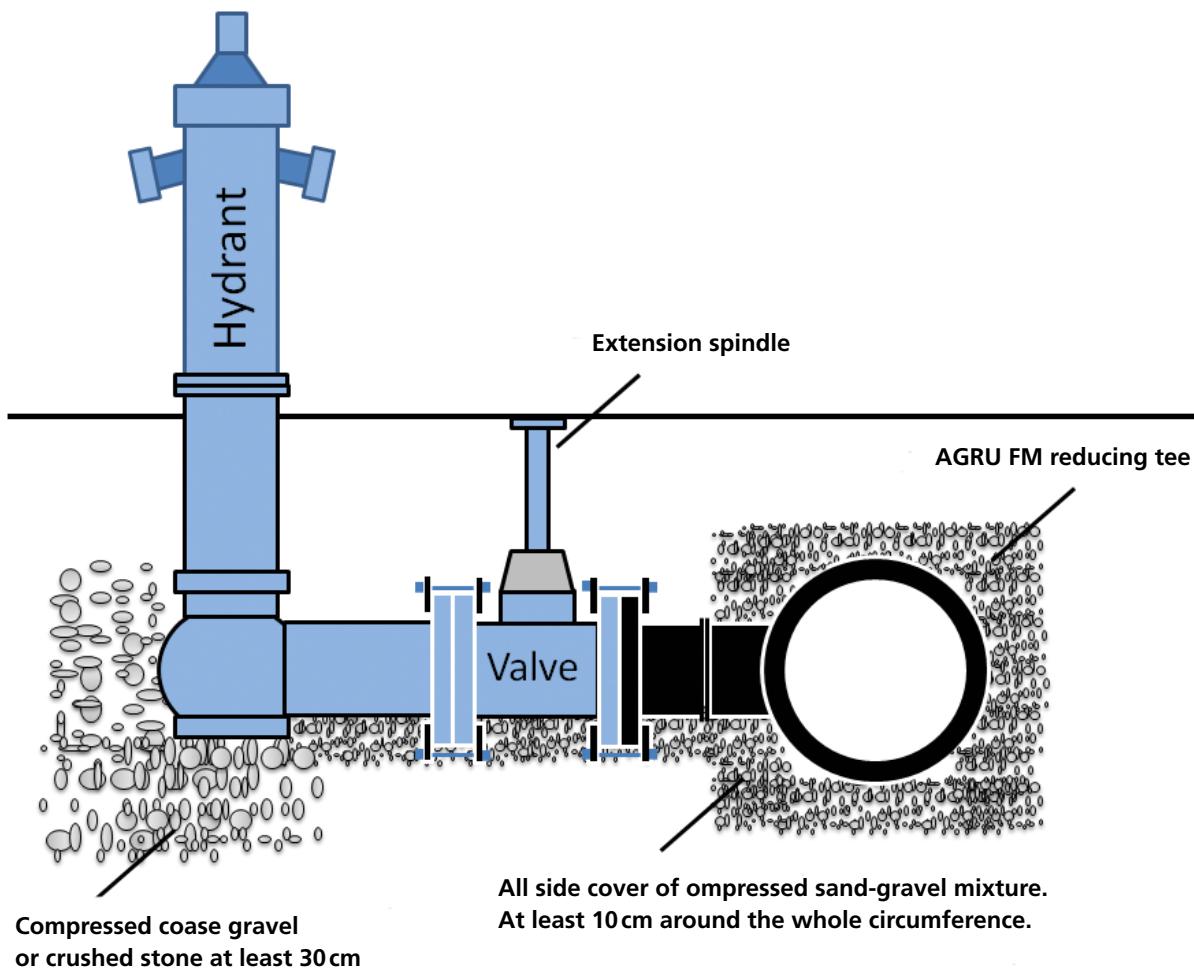

10 Anchor

Anchors can be created under certain circumstances to limit the movement of HDPE when transitioned with other types of pipe or connected to a pump or valve. The drawing below shows steel reinforcement located near the puddle flange (fix point) to compensate the forces of expansion and contraction which un-reinforced concrete might not handle.

11 Hydrant Connection

Connection to a hydrant requires flanges. Due to its weight it is recommended to support the hydrant at the bottom with compressed coarse gravel or crushed stone for at least 30 cm. If the soil around the hydrant does not provide sufficient stability, it is recommended to use geotextile fabrics to stabilize the area around the hydrant bottom. This prevents soil settlements which can lead to high bending moments on the pipe and the connections.

12 Hydrostatic pressure test

In order to check the entire finished pipe system for leaks, a hydrostatic pressure test according to EN 805 and/or national standards is recommended. For safety reasons it is not recommended to test with compressed air, only water is suitable!

12.1 Filling and checking

The filling of the pipeline with clean water should be conducted with open air valves and adequate venting. Calibration of the testing equipment should be carried out, before the equipment is connected to the pipe and the pressure test is started. During the test all venting devices should be closed.

12.2 Preparation pressure test

To prevent the pipeline from moving, it should be covered with enough back-fill material before the pressure test. The joints may be left uncovered. The anchors and the bearings must verifiably withstand the forces caused by the test pressure. The test should be conducted either on the complete pipeline or in sections. When the pipeline is filled, the system test pressure (STP) must be reached at the lowest part of the pipeline. At the same time the system working pressure (MDP) must be reached at least at the highest point of each testing section. Before the pressure test the pipe has to be cleaned from any kind of contamination and has to be ventilated.

12.3 Test pressure

The system test pressure (STP) can be calculated with following formula by taking the highest system working pressure MDP into account:

$$STP = MDP_c + 100 \text{ kPa}$$

By not considering the pressure surge:

$$STP = MDP_a \cdot 1,5$$

or

$$STP = MDP_a + 500 \text{ kPa}$$

The lower of the two values is valid.

The pressure surge should be calculated with appropriate basic equations and assumptions of the engineer (worst case). The testing equipment should be connected to the pipeline at its the lowest part.

For the calculation of short pipe sections and branch lines $\leq DN 80$ and shorter than 100 m, the operating pressure can be assumed as system working pressure, if not otherwise specified.

12.4 Types of pressure tests

The type of pressure test is determined depending on the type of the pipe and the material.

The pressure test can consist of up to three parts:

Pressure pre-test

Integrated pressure loss test

Main pressure test

12.5 Pressure pre-test

The pressure pre-test is carried out to avoid incorrect test results during the main pressure test.

During the pre-test following steps are carried out:

- Relaxation phase (min. 1h) after the purging and venting of the pipeline.
In the process the air must not get into the test sections.
- Continuous pressure increase (within 10 min) to the system pressure (STP)
and subsequent holding of the pressure (30 min). During that period the pipeline should be inspected for leakages.
- Wait the rest period (1h) without re-pressurising and measure the residual pressure.
If the pressure drop is higher than 30% of the STP, then the pressure test has to be stopped to search
for the cause of the failure. The rerun of the test is only possible 1h after relaxation phase at the earliest.
- When the pre-test is completed successfully, the main pressure test can be started.

12.6 Integrated pressure loss test

The pressure loss test is used to determine the residual air volume in the pipeline. It allows to improve the precision of the main pressure test. During the pressure loss test the following steps are performed:

- Rapid pressure reduction (Δp : 10 – 15% of STP) by draining the water
- Measuring the volume of the drained water
- Calculating the allowable loss of water ΔV_{max} according to the following equation:

$$\Delta V_{max} = 1,2 \cdot V \cdot \Delta p \cdot \left(\frac{1}{E_w} - \frac{1}{e \cdot E_r} \right)$$

ΔV_{max} allowable loss of water [l]

V volume test section [l]

Δp measured pressure drop [kPa]

E_w compressive modulus water [kPa]

D inner diameter of the pipe [m]

e wall thickness of the pipe [m]

E_r Young's Modulus pipe wall in circumferential direction [kPa]

1,2 factor: allowable amount of air before the main pressure test

Checking if $\Delta V > \Delta V_{max}$. If ΔV is higher, the pressure test has to be stopped and repeated after the relaxation phase.

12.7 Main pressure test

The integrated pressure loss test interrupts the viscoelastic expansion of the pipe and leads to a contraction of the pipeline. The resulting pressure rise is monitored and recorded in the period of 30 minutes. If the pressure curve doesn't drop during the monitoring period, the main pressure test is considered as passed. A drop of the pressure curve indicates a leakage in the pipeline. When uncertainty exists, the test duration can be extended to 90 minutes. In doing so the pressure drop cannot exceed 25 kPa, otherwise the main pressure test is considered as failed. The repeat of the main pressure test is only possible if the complete test process (+1h relaxation phase) is repeated.

13 Specification of AGRU PE 100 pipes and fittings for underground fire protection systems

1. Scope

Requirements on FM approved pipes and fittings made of PE100 for underground fire protection systems.

2. Materials

High quality and virgin PE 100 and PE 100-RC materials that are listed by the PE 100+ association.

3. Pipes

Pipes should be produced according to ISO 4427, EN 12201 and/or AWWA C906.

As required by FM approval standard 1613, all FM approved pipes shall bear the Approval Mark.

The Approval Mark shall be displayed visibly and permanently on the products.

4. Fittings

Fittings should be produced according to ISO 4427 and EN 12201, and certified according to EN 12201 and FM 1613.

As required by FM approval 1613, all FM approved fittings shall bear the Approval Mark.

The Approval Mark shall be displayed visibly and permanently on the products. Whenever available, injection molded fittings should be used preferably.

5. Approved Manufacturer

FM approved PE 100 or PE 100-RC Fittings should be provided by AGRU, FM approved PE 100 or PE 100-RC pipes should be provided by AGRU-FRANK. Pipes and fittings should be produced and supplied by the same company as a complete system. Manufacturer must be ISO-9001 and ISO 14001certified. An inspection certificate acc. to EN 10204 (3.1) must be provided by the manufacturer on request.

6. Pressure rating

FM approved pipes and fittings shall have a pressure rating at 20 °C of:

CERTIFIED PRESSURE FOR FIRE PROTECTION SYSTEMS (Operating pressure)	DESIGN PRESSURE ACCORDING TO EN 12201
175 psi	12 bar
200 psi	14 bar

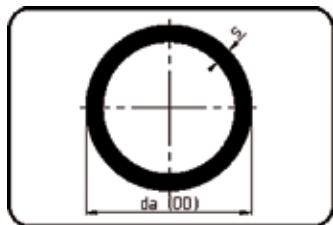

8. Installation procederes

Product information and installation procedure data must be available by the producer/supplier. This data must be released by FM approvals as well/or in accordance to FM global property loss prevention data sheet 3-10 and/or NFPA 24.
